

Introduction To React

1 . React is JavaScript FrontEnd Library which is used for Single Page Application(SPA) and user interface.

2. Single Page Application:

SPA is web application in which only single html page(index.html in react) will be loaded on the browser and update the content dynamically.

3. History -

- a. React first developed by Jordan Walke in 2011 (Facebook - NewsFeed)
- b. in 2012 - Instagram
- c. in 2013 React - open Source .

4 .Installation Process

- a . node.js → Install it
 - i) Nodejs is a runtime envt which run the javascript outside the browser .
 - ii) npm - node package manager ← nodejs has bundle help to install dependencies .
- b. Version → latest
- c. Open Command Prompt
 - i) node -v ← Tell the version of node js
 - ii) npm -v ← Tell the version of node Package Manager
 - iii) npm install vite@latest ← To create React Application we will use vite bundle/tool [Install Only once in a CMD]

5 . Create and run a project

Create an Folder and Open in VS code .

NEXT STEPS:

i) `npm create vite@latest AppName` ← SYNTAX

Eg - `npm create vite@latest myapp`

This command: Creates a new folder called **myapp**

Installs React, React-DOM, Babel, Webpack, etc.

Sets up project structure and scripts

ii) `cd AppName` ← SYNTAX

Eg - `cd myapp`

iii) `npm install` ← install more dependencies in myapp

iv) `npm run dev` ← A local Server will start at <http://localhost:5173/>

=====

FLOW OF REACT :
